Section 1 – General Idea

What I find bad/can be improved in this idea is

Aiming to have visualisations is a great idea but I'd like to suggest you use a more high-level/advanced visualisation package than matplotlib like Seaborn, which is based on matplotlib, or Plotly e.t.c, which would allow you to create better quality visualisations based on your findings.

What I find good/has potential in this idea is

I find the use of the NBA Traditional statistics dataset as good due to it having many key statistics such as points, assists, and shooting percentages are key indicators of how well a player/team is performing. These statistics would be great features for any predictive modelling they might try e.g. predicting how many wins/losses a team may end up with after an 82 game NBA regular season or how the teams will be seeded for the 2025/2026 playoffs.

One problem/challenge you might encounter with this idea is

As some of these key statistics could be heavily correlated, multicollinearity could become an issue when trying to use these features together for a machine learning model. Performing manual feature selection or running a feature selection algorithm could be beneficial when trying to overcome this issue. This could also be a good read. <https://datascience.stackexchange.com/a/24490>

Section 2 – Technology

Technology 1

One key technology used in this project is

Apache Pig

Does this technology fit the general idea?

☒ Yes ☐ No

If Yes, one way the app can be expanded/improved using such technology is

They could use Apache Pig to automate some of the more tedious data cleaning processes. This includes standardizing Team and Player Names, as well as checking the thousands of player attributes for missing data in important stats like points, rebounds, and assists. These efforts could significantly reduce the workload, whilst at the same time ensuring a more accurate and consistent dataset.

If No, why?

Technology 2

Another key technology used in this project is

Apache Spark (with SparkML)

Does this technology fit the general idea?

☒ Yes ☐ No

If Yes, one way the app can be expanded/improved using such technology is

SparkML could be used by the team to develop a more advanced and a more accurate predictive model. For example, they could train a classification model to predict playoff qualifications based on key data such as offensive efficiency, turnover percentage, defensive rating and more. They could also possibly predict the efficiency ratings of individual players, giving great insight on what it requires to be successful in the NBA.

If No, why?

Section 3 – Task allocation and user roles

Is the task allocation fair/reasonable?

☒ Yes

☐ No

If Yes, who do you think is a good leader candidate for the group and why?

I do think the allocation is fair as each of Belbin's team roles are assigned equal to each team member. I think Lee Hickey, LH, would be a good leader candidate as group K assigned him as coordinator which is a role that delegates work for the team and keeps the team focused on their objectives.

If No, say why and indicate at least one advice for improving fairness in task allocation.
